

the Tarim Craton. *Geologi-*

the northern margin of the Tarim Craton. It is suggested that these granitic rocks were derived from partial melting of magma from mantle sources. The age of 650 Ma indicates that the 650~615 Ma magmatic event occurred prior to the breakup of the supercontinent Pangea. In the early Cambrian, some 550 Ma ago, the age of the rocks indicates that
